ENTER THE SECOND ROUND OF ATCC

ATCC as the most representative **national business competition**, joining it is on of my university wishlist. In this competition, we provided a **business proposal** for Taiwan Bar (a digital media firm). In this competition, we aim at creating a new **business model for digital media** firm and increasing the content engagement to target audiences.

CLASSIFY CLOTHING CATEGORY WITH TENSORFLOW

I am the **leader** of this project team. The target of this project is using **compter vision** to classify costumers' clothing attributes. After that, we will use these attributes data for predicting the garment products which costumers will be interested. We used **Inception-V3** model from Google **Tensorflow** to do the object detection.

FRONT-END DEVELOPING WITH REACT.JS

I used **React.js** to build a web application which involved the technique of Axios (**API serialization**), React Hook, Infinite-Scroll, Router, etc. The link of the above project can be found in the bottom QR code. Recently, I am working on other interesting projects with React.js.

BROADEN MY HORIZONS

The experience in this company is really interesting. We were developing a SaaS (薈客) for education industry. As the **assistant of PM**, I did **competitive analysis**, the **testing in specifications** and **developed the webpage** for promoting our SaaS product. This provides me with a good opportunity to understand the scale of Shenzhen's IT industry.
